### Course Description

This one-hour course makes the case that Universal Design and Environmentally Sustainable Design can be merged into Socially Sustainable Design and become best practice used in all good design. With a focus on bathroom design, we explore what makes a restroom friendly and accessible to all while providing state-of-the-art water efficiency and disease-free surfaces. The goal is a socially sustainable bathroom that provides comfort and facility for allowing users of all ages while preserving health, independence, and dignity. The attendee also will receive information on tools which reduce design time and help meet the criteria for LEED certification. The course will conclude with a brief Q&A.

### Course Objectives:

Upon completion of this course, the design professional will be able to:

1. Recognize the seven principles of Universal Design
2. Select the features of a bathroom that maximize an elderly or disabled person's ability to live independently with dignity
3. Distinguish between reducing the volume of water used in a building and reducing flow rates
4. Select technologies for use in designing bathrooms which meet the need to earn LEED points and will be able to pass the test of time by staying in the building
